

[illegible]

5 determine the optimal packet-size for the channel condition. An optimal RLP packet-size that corresponds to the processed channel condition metric is chosen. All the optimal RLP packets that are control type are equipped with CRC bits and sent to the requestor. Sending an optimal RLP packet helps maximize system throughput and adding CRC bits to the control type RLP packets
10 prevents the RLP packet from getting rejected due to bit errors.
